PROJECT STATUS REPORT

Project Name	Freight Shield
For Week Ending	Jan 22nd
Project Status	Yellow 😐
Status Description	Wasn't able to get the main progress we wanted with connecting the web application and mobile client. Mostly just smaller changes in preparation for larger ones ● In order to get to yellow, need to get that communication to work, most of the value added for the project is coming from it

Activities—During the Past Week

- Integrated the Google Maps API to web client. Got it to suggest addresses in the forms for posting an assignment
- Initialized the mobile application with some basic UI and pages, which are still inactive at the moment
- Made a couple new basic page layouts for carriers managing drivers and their vehicles,
- Wrote out some changes to what tasks/use cases each page services, since it currently feels like we're deviating from the planned uses for each page

Activities—Planned for Next Week

- Connecting up the mobile and desktop clients
- Adding more layouts and functionality to those pages to get each user story to work in preparation for testing
- Remaking some documentation to better understand user needs and tasks
- Changes to development environment
- User testing

Project Issues

- Issues with trying to get some of the pages to be properly reactive, to read/write information from the database (in the same vein as the form for job posting)
- Also some issues with mapping each page to each use case, need to clarify what parts work for what.

● A lack of progress between this and the last week, needed to show more than the same job posting form ● Not having user testing and feedback for current features

Project Changes
● Some basic UI changes to several carrier and shipper pages ● Updated the active load model, the schema now includes more information, and changed the form for active loads to match it
